

A NEW GENERATION OF ASSET-BASED LENDING SOFTWARE

Economic uncertainty, volatile financial markets, and tightening credit markets have been major concerns for financial organizations over the past year. As you look forward into the next year, what are your goals to protect and grow your business?

Take Your Business to New Heights

Financial organizations must make strides to operate efficiently while reducing the risks of bad loans, and at the same time, bring in new business. Whether you already have software in place or are looking to invest in new asset-based lending software, it's a good time to assess your situation and decide what software can best help you reach your goals.

In choosing a system that can grow with you, here are a few things to consider.

- Does the software include data entry and document management automation tools that can dramatically improve your operational efficiency, collateral protection and bottom line?

- Does the software offer a seamless end-to-end Web system, from its client portal to the back office, for conducting business anywhere at any time?
- Does the software offer full asset-based lending functionality as well as flexibility to be tailored to your method of protecting your collateral -- without a hefty price tag?
- Does the software have an intuitive interface that requires minimal user training and set-up time?

While there are several asset-based lending software systems today, many are based on older technologies with disparate, add-on modules that were not originally intended for the Web environment that businesses operate in today.

Increase Customer Satisfaction

By contrast, ABLSoft's **Radar** software is a new generation of asset-based lending software built from the ground-up as a 100% browser-based application. Monitor collateral and interact with customers anywhere, at any time, whether it is the office, home or airport. Radar's client portal will be a powerful selling point to your clients. Its rich functionality allows your clients to request advances online, view and search for check images, update new information about eligibles, share documents directly from their Web browser, update their borrowing bases, as well as upload agings and financial statements.

Work Efficiently

Radar's intelligent design goes beyond other systems with tools for automating aging uploads, financial spreading, document management and ineligible calculations. These

tools save valuable time and money by eliminating the tedious tasks of manual data entry, searching document files, and faxing and emailing between clients. These capabilities are seamlessly integrated into the Radar software and are not third party add-ons. This translates to a clean and intuitive user interface, for both you and your clients, without any added costs.

Work Smarter

Designed to help you work smarter, Radar's powerful business rules engine never sleeps. It adds a new dimension by actively monitoring data for exceptions and ticklers, which then triggers off alerts that are emailed, text-messaged, or routed through your custom workflow. In addition, the rules engine can be configured to handle your "secret sauce", such as custom business rules, eligibles, reports, and covenants with little to no technical expertise.

Improve Your Bottom Line

Radar can adapt to your company needs as you grow without a large price tag. It can be your full service lending system, or it can complement your other software investments. We offer a simple pay-as-you-go pricing model with no major investment upfront. As a 100% Web application, you are up and running quickly with nothing to install and minimal dependence on IT resources.

It is easy to get started with Radar. Be a part of the new generation. For a demo, please contact Nancy Lee at 866-632-7146 (x109) or nlee@ablsoft.com. Visit us at www.ablsoft.com.
